

# Instagram User Analytics

## Project Description:

In this project, I have to use SQL and MySQL Workbench to study how users interact with the app. This involves tracking user behaviour to provide insights. These insights are valuable for teams like marketing, who can use them for campaigns, product teams to decide on new features, and development teams to enhance user experience. The goal is to make informed decisions about Instagram's future development, potentially influencing one of the world's most popular social media platforms.

## Approach:

To effectively analyze Instagram user data using SQL and MySQL Workbench, my approach would start with understanding the specific questions posed by the management team. I'll identify key metrics such as user engagement, feature popularity, and behavioral patterns. Leveraging SQL queries, I'll extract relevant data, conduct exploratory analysis, and generate meaningful insights.

## Tech-Stack Used:

MySQL 8.0 Workbench

## Insights

By effectively analyzing the data I have got few insights

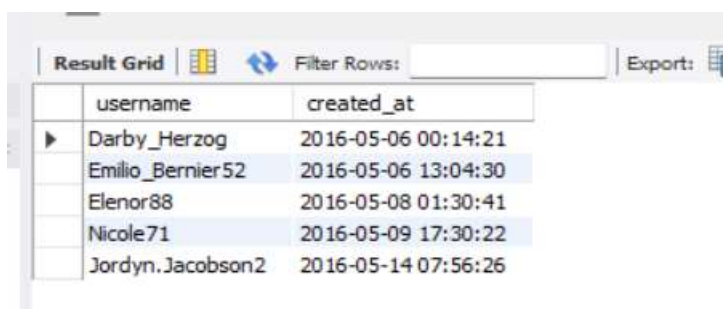

A) Marketing

## Task 1:

In order to reward most loyal users, find the 5 oldest users of the Instagram from the database provided.

```
SELECT
    username, created_at
FROM
    users
ORDER BY created_at
LIMIT 5
```

Output:

The screenshot shows the MySQL Workbench interface with the 'Result Grid' tab selected. It displays the results of the SQL query, showing the usernames and creation dates of the 5 oldest users. The table has two columns: 'username' and 'created\_at'. The data is as follows:

| username         | created_at          |
|------------------|---------------------|
| Darby_Herzog     | 2016-05-06 00:14:21 |
| Emilio_Bernier52 | 2016-05-06 13:04:30 |
| Elenor88         | 2016-05-08 01:30:41 |
| Nicole71         | 2016-05-09 17:30:22 |
| Jordyn.Jacobson2 | 2016-05-14 07:56:26 |

## Task 2:

Find the users who have never posted a single photo on Instagram.

```
• SELECT
    u.username
FROM
    users u
LEFT JOIN
    photos p ON u.id = p.user_id
WHERE
    user_id IS NULL
ORDER BY u.username;
```

## Output:

|                     |                    |
|---------------------|--------------------|
| username            | Janelle.Nikolaus81 |
| ▶ Aniya_Hackett     | Jessyca_West       |
| Bartholome.Bernhard | Julien_Schmidt     |
| Bethany20           | Kasandra_Homenick  |
| Darby_Herzog        | Leslie67           |
| David.Osinski47     | Linnea59           |
| Duane60             | Maxwell.Halvorson  |
| Esmeralda.Mraz57    | Mckenna17          |
| Esther.Zulauf61     | Mike.Auer39        |
| Franco_Keebler64    | Morgan.Kassulke    |
| Hulda.Macejkovic    | Nia_Haag           |
| Jadlyn81            | Ollie_Ledner37     |
| Janelle.Nikolaus81  | Pearl7             |
|                     | Rocio33            |
|                     | Tierra.Trantow     |

## Task 3:

Identify the winner of the contest by finding out which user gets the most likes on a single photo and provide their details to the team.

```
• WITH likes as
(
    SELECT l.photo_id,u.username, COUNT(l.user_id) AS most_likes
    FROM likes l
    JOIN photos p ON l.photo_id = p.id
    JOIN users u ON p.user_id = u.id
    GROUP BY l.photo_id,u.username
    ORDER BY most_likes DESC
    LIMIT 1
)
SELECT username FROM likes;
```

### Output:

| Result Grid     | Filter Rows: |
|-----------------|--------------|
| username        |              |
| ▶ Zack_Kemmer93 |              |

### Task 4:

Identify and suggest the top 5 most commonly used hashtags on the platform.

```
SELECT
    t.tag_name, COUNT(p.photo_id) AS num_tags
FROM
    tags t
JOIN
    photo_tags p ON t.id = p.tag_id
GROUP BY t.tag_name
ORDER BY num_tags DESC
LIMIT 5;
```

### Output:

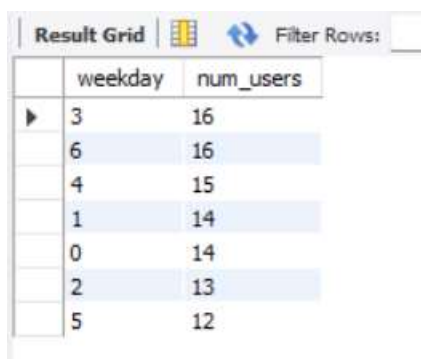

| Result Grid | Filter Rows: | Export |
|-------------|--------------|--------|
| tag_name    | num_tags     |        |
| ▶ smile     | 59           |        |
| beach       | 42           |        |
| party       | 39           |        |
| fun         | 38           |        |
| concert     | 24           |        |

### Task 5:

What day of the week do most users register on? Provide insights on when to schedule an ad campaign.

```
SELECT
    WEEKDAY(created_at) AS weekday, COUNT(username) AS num_users
FROM
    users
GROUP BY 1
ORDER BY 2 DESC
```

### Output:

The screenshot shows a 'Result Grid' with a 'Filter Rows' button. The table has two columns: 'weekday' and 'num\_users'. The data is sorted in descending order of 'num\_users'.

|   | weekday | num_users |
|---|---------|-----------|
| ▶ | 3       | 16        |
|   | 6       | 16        |
|   | 4       | 15        |
|   | 1       | 14        |
|   | 0       | 14        |
|   | 2       | 13        |
|   | 5       | 12        |

If we find the date by using created\_at, we will come to know the day corresponding to the dates. Here, 0 – Monday, 1 – Tuesday, 2 – Wednesday, 3 – Thursday, 4 – Friday, 5 – Saturday, 6 – Sunday

We can see maximum number of users are registering on 3 and 6 i.e. Thursday and Sunday

## B) Investors metric

### Task 6:

Provide how many times does average user posts on Instagram. Also, provide the total number of photos on Instagram/total number of users.

- Average user post on instagram

```
-- Average_post_per_user
WITH post as
(
  SELECT u.id AS user_id,
  COUNT(p.id) AS photoid
  FROM users u
  LEFT JOIN photos p
  ON u.id = p.user_id
  GROUP BY u.id
)

SELECT SUM(photoid)/count(user_id) AS avg_post_per_user
FROM post
WHERE photoid > 0;
```

### Output:

| Result Grid |                   | Filter Rows: |
|-------------|-------------------|--------------|
|             | avg_post_per_user |              |
| ▶           | 3.4730            |              |

- Average Photos per user

```
-- Average photo per user
WITH post as
(
  SELECT u.id AS user_id,
  COUNT(p.id) AS photoid
  FROM users u
  LEFT JOIN photos p
  ON u.id = p.user_id
  GROUP BY u.id
)

SELECT SUM(photoid) AS total_photos,
count(user_id) AS total_users,
SUM(photoid)/count(user_id) AS photos_per_usr
FROM post;
```

## Output:

|   | total_photos | total_users | photos_per_usr |
|---|--------------|-------------|----------------|
| ▶ | 257          | 100         | 2.5700         |

## Task 7:

Provide data on users (bots) who have liked every single photo on the site (since any normal user would not be able to do this).

```
WITH photo_count AS
(
    SELECT user_id,
    COUNT(photo_id) AS num_like
    FROM likes
    GROUP BY user_id
    ORDER BY num_like DESC
)

SELECT *FROM photo_count
WHERE
num_like = ( SELECT count(*) FROM photos)
```

## Output:

|   | user_id | num_like |
|---|---------|----------|
| ▶ | 21      | 257      |
|   | 71      | 257      |
|   | 5       | 257      |
|   | 66      | 257      |
|   | 41      | 257      |
|   | 14      | 257      |
|   | 57      | 257      |
|   | 24      | 257      |
|   | 76      | 257      |
|   | 75      | 257      |
|   | 54      | 257      |
|   | 91      | 257      |
|   | 36      | 257      |

As any normal person won't like every single photo on instagram, I conclude that these users are bots.

**Conclusion:**

In conclusion, these SQL analyses contribute valuable insights for the marketing team to recognize loyal users, encourage inactive users, declare contest winners, and optimize content strategy. Simultaneously, investor metrics focus on user engagement and the identification of potential fake accounts, offering a comprehensive view of Instagram's health and authenticity for potential investors.
